Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.

The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha/betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenoviral penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the bispecific molecule is

CC an existing platelet thrombus in a blood vessel is due to dissociation of the binding of an integrin-ligand dissociator at ligand binding site I of the binding of an integrin-ligand dissociator at ligand binding site I of the glycoprotein IIb-IIIa. The invention provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet thrombus may form an occlusion of a blood vessel, where the platelet thrombus may form an occlusion of a blood vessel, where the platelet thrombus may form an occlusion of a blood vessel, in a subject comprises administering a compound which dissociates fibrinogen bound to a first interesting site on platelet glycoprotein IIb-IIIa, disaggregating the consistency of the method is used to treat humans with unstable and/or acute myocardial infarction. The methods can be used to enact de-adhesion of osteoclasts from the bone surface to halt for the de-adhesion of anglogenic endothelial cells in a patient with a patient with anglogenesis, e.g. cancer, diabetic retinopathy, psoriasis. The methods can also be used to treat tumours, bowel disease, or organ transplant rejection, and asthma. The methods can be used for the dissolution of pre-formed platelet aggregates, which is a departure from the current strategy of treatment prior to formation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                      fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and metalloprotease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold cabe designed to have a predetermined resorption/degradation rate, and may include regulatory compounds for specific cell types.
                                                                                                                                                                                                                                                                                                                                    System for reconstructing osseous tissue, useful e.g. for fractures, comprises scaffold containing promoter of bone inhibitor of bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2000-195084/17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                              The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated Leukocyte adhesion to the CS-1 FN of endothellal cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis, ellipse).
                                                               immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fibronectin; FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

                                                                                                                                                                                                                                                                                                                                        which contain the CS-1 domain. The novel compounds inhibit cell adhesion and consequent or associated pathogenic processes mediated by VrA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanolc acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCAM-1 (vascular cell adhesion nolecule-1) and for the alternatively spliced forms of fibronectin (FN)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VLA-4
                                                                                                                                                                                                                                                                          inflammatory bowel disease. Sequences AAY69618-Y69620 represent p derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-depend
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LDV peptide: VLA-4 inhibitor; very late antigen; alpha-4-beta-1; CD49d/CD29; cell adhesion; arylalkyl azolylalkanoic acid derivative; arylureidoalkyl azolylalkanoic acid derivative; inflammatory disorder; autoimmune disorder; respiratory disorder; LDV motif.
                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                       alpha-4-subunit containing integrins or antagonists of alpha-1-subunit-containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen), alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCA-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic end-stage renal disease, chronic diabetic nephropathy, diabetic planerulopathy, diabetic renal hypertrophy, hypertensive nephrosclerosis, hypertensive glomerulosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysphasia. Sequences AAB73464-AAB7366 represent peptides derived from the VLA-4 binding domain (CS-1 region) of
                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                very late antigen; antibody; kidney disease; chronic renal failure; end-stage renal disease; chronic diabetic nephropathy; diabetic glomerulopathy; diabetic renal hypertrensive nephrosclerosis; hypertensive nephrosclerosis; hypertensive glomerulosclerosis; hereditary nephritis; renal dysplasia; nephrotropic; cell adhesion inhibition; fibronectin CS-1 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB73465

                                                                                                                                                                                                                                                            bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-MAY-1999;

It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ginsberg

                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an CC the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4 mediated comportant role in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics and cc critical step in the inflammatory response. The peptidomimetics of the contral nervous system CC close to the contral nervous system CC close to the contral nervous system CC allograft rejection. They may also be used to treat psoriasis and other CC involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in CC comparison to the CS-1 peptide and therefore less expensive to their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide for CC (AAY77410).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW56065
                                                                                                                                                                                                                                                                                                                                                    RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC capable of inhibiting the binding of the VA-4 integrin (alpha-4-beta-1, CC capable of inhibiting the binding of the VA-4 integrin (alpha-4-beta-1, CC CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of CC the surface lular matrix protein fibronectin (FN). VLA-4 is expressed on CC the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an CC important role in the maturation and trafficking. VLA-4 mediated CC clukocyte adhesion to the CS-1 FN of endothelial cells is also a CC critical step in the inflammatory response. The peptidomimetics of the CC cinvention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and CC allograft rejection. They may also be used to treat psoriasis and other CC skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, CC diabetes, inflammatory bowel disease, kidney inflammation and CC restenosis. Perior art inhibition of VLA-4/CS-1 interaction either CC involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, CC which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in CC comparison to the CS-1 peptide and therefore less expensive to their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide (CAAY774410).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                            endothelium and into tissues. It acts by blocking the alpha4-betal extracellular matrix receptor. Admin. of the peptide can suppress the immune response and treat diseases associated with chronic or relapsing activation of the immune system, including collagen vascular diseases and other autoimmune diseases, multiple sclerosis, asthma, allergy and chronic inflammatory skin conditions.
                                                                                                                                                                                                                                                                           The peptide is derived the CS-1 peptide (Humphries et al., 198 J. Biol. Chem. 262:6886-6892), from the IICS variable region fibronectin. The peptide inhibits binding of lymphocytes to endothelial cells preventing migration through the vascular endothelium and into tissues. It acts by blocking the alpha4
